

This assignment took me about 10 hours to complete. I started these a couple of days after the assignment was announced but took me all the way till now because of tests and not being motivated. I found some aspects of this assignment to be easy like polymorphism but also the inheritance did make me think when creating methods. The easy parts for me are creating the parent and child classes. Implementing those together and using dynamic cast I found difficult. I learned more about problem-solving with errors that are vague and trying to get information from the child classes. I would spend more time making the menu and submenus look better, and making it more user-friendly. I have no other comments.
